

Fabricated Fittings: BEVELS/ END CAPS/ TEES

DESCRIPTION

Shur-Fit Products' Fabricated Fittings are manufactured from:

- premium grade 3003 series aluminum in .020" thickness. They are available in smooth and stucco embossed aluminum, tedlar coated, painted aluminum or galvanized metals.
- T316 stainless steel in .016" thickness. They are available in smooth and stucco embossed finishes.

All come with a PolySurlyn™ moisture barrier and they are available from 2 7/8" OD to your largest size required. The End Caps and Bevel are manufactured with a pittsburgh collar, and the Tees with a flare lock.

APPLICATIONS

In mechanical pipe systems in cold storage facilities, food processing and industry plants:

- Bevels are used to transition from one OD to another.
- End Caps are used at termination points to protect the insulation and vapor barrier.

ADVANTAGES

Shur-Fit Products' Fabricated Fittings are the best solution in vertical piping systems since the flat collar is able to sit tight to the metal jacket underneath, ensuring a watershed in the jacketing system.

They are manufactured from the same material as the straight jacket (*3003 series aluminum or T316 stainless steel*), which resists damage much more than soft metals used for deep drawing such as pressed elbows. This material allows the product to blend into the system, providing a professional finish. The PolySurlyn™ multilayered moisture barrier provides resistance against corrosion.
